Referent: Leonie Ulrich, Institute of Applied Physics, University of Bern

Titel: From bench to bedside: challenges of quantitative hypoxia imaging

Spectral optoacoustic (OA) imaging allows a spatially resolved estimation of oxygen saturation levels in tissue. However, wavelength-dependent light attenuation in the bulk tissue causes a distortion of the spectral OA signal and therefore makes quantitative imaging challenging. In a feasibility study, we combined OA imaging with near infrared optical tomography to perform a spectral correction of the OA signals. The use of a simplified tissue phantom allowed us to identify the challenges of the combined technique and to develop a more general methodology for the quantitative analysis of OA signals originating from vessels. This is a prerequisite for a future clinical application of the combined system.
